4 INTRODUCTION.....	1
5 ARGUMENT	1
6 I. CLAIM 41'S PREAMBLE IS LIMITING AND REQUIRES THE 7 CLAIM'S STEPS TO BE PERFORMED BY A TRANSMISSION 8 SYSTEM.	1
9 A. The Phrase "Performed by a Transmission System" was 10 Added To the Preamble of Claim 41 to Gain Allowance.....	2
11 B. The Preamble Limits Claim 41 Because the "Transmission 12 System" is the Structure That Performs the Steps of the 13 Claim and Because the "Transmission System" was 14 Represented to be Significant in the Petition to Make 15 Special.	3
16 C. Acacia's Misapplication of Federal Circuit Precedent is 17 Unconvincing.	5
18 II. THE STEPS OF CLAIM 41 MUST BE PERFORMED IN 19 SEQUENTIAL ORDER.....	6
20 A. The Steps of Claim 41 Must be Performed in Order and 21 After Any Prior Steps Are Completed.	7
22 B. Acacia's Attempt to Blur the Sequence of the Claim is 23 Unsupported.	11
24 III. THE PHRASE "ONE OF THE REMOTE LOCATIONS" IN 25 CLAIM 41 SHOULD BE CONSTRUED TO MEAN "ONE AND 26 ONLY ONE OF THE REMOTE LOCATIONS."	12
27 A. The Ordinary Meaning of "One" Requires Construing "One 28 of the Remote Locations" to Refer to a Single Remote Location.....	12
B. Acacia Offers No Persuasive Reason to Deviate from the Ordinary Meaning of "One."	14
C. The Specification Confirms the Ordinary Meaning of "One of the Remote Locations."	15
1. The Specification Discloses Numerous Embodiments that Describe Singular, Rather Than Plural, Remote Locations.	16

1	2. The Specification Does Not Provide a Special Meaning for the Term “One.”	17
2	D. Language from Other Claims Confirms the Meaning of “One of the Remote Locations.”	17
3	E. The Prosecution History of the ‘863 Patent Confirms that the Phrase “One of the Remote Locations” Points to a Single, Particular Remote Location.....	18
4		
5	IV. THE TERM “ITEMS’ HAVING [OR CONTAINING] INFORMATION” SHOULD BE CONSTRUED TO MEAN “PHYSICAL OBJECTS ON WHICH INFORMATION IS STORED.”	21
6		
7	A. The Context of Claim 41 Requires Defendants’ Construction of “Items Having [or Containing] Information.”	22
8		
9	B. Acacia’s Proposal to Define “Items” Having or Containing Information as a “Thing” is Unavailing.	23
10		
11	V. THE TERM “ADDRESSABLE” REQUIRES THAT THERE BE A KNOWN ASSOCIATION BETWEEN A DATA BLOCK AND ITS STORAGE LOCATION.	26
12		
13	A. The Transmission System Must Have a Known Association To Retrieve The Data Blocks; Mere Ability is Not Enough.	27
14		
15	B. “Addressable” Means that There Is a Known Association Between a Data Block and its Storage Location.	28
16		
17	C. Addressability Must be Within the Transmission System.	30
18		
19	D. The Data Blocks Cannot be “Within” the Items.	30
20		
21	VI. CLAIM 45 IS INSOLUBLY AMBIGUOUS, AND THE CLAIM IS INDEFINITE.	31
22		
23	CONCLUSION	32

INTRODUCTION

The current round of *Markman* briefing is limited to the terms of the ‘992 and ‘275 patents. Acacia accuses EchoStar and DIRECTV (the “Satellite Defendants”) only of infringing Claims 41-45 of the ‘992 patent. The ‘275 patent is not asserted against the Satellite Defendants. The Satellite Defendants therefore jointly submit this claim construction brief, which covers the remaining disputed terms in Claims 41-45 of the ‘992 patent.

ARGUMENT

Claims 41-45 of the ‘992 patent present six issues for consideration. *First*, the preamble of Claim 41 should be construed to be a limitation requiring that all of the recited steps be performed by a “transmission system.” *Second*, all of the steps of Claim 41 must be performed in the recited order and prior steps be completed before subsequent steps begin. *Third*, Claim 41 refers to sending information to “one of the remote locations.” The claim language, specification, and plain meaning of the word “one” make it clear that this phrase should be construed to mean “one *and only one* of the remote locations.” *Fourth*, the term “items,” as used in the phrase “items having information,” should be construed to mean “physical objects on which information is stored.” *Fifth*, the term “addressable,” as used in the phrase “sequence of addressable data blocks,” should be construed to mean that “that there is a known association between each data block and its storage location so that the transmission system can retrieve any individual data block by using its storage location.” *Sixth*, dependent Claim 45 is insolubly ambiguous and is therefore indefinite.

I. CLAIM 41'S PREAMBLE IS LIMITING AND REQUIRES THE CLAIM'S STEPS TO BE PERFORMED BY A TRANSMISSION SYSTEM.

A preamble is limiting if it recites structure that is important to the invention, is necessary to give meaning to the claim, or is relied on by the applicant during prosecution. *See, e.g., Bicon, Inc. v. Straumann Co.*, 441 F.3d 945, 952 (Fed. Cir. 2006); *Invitrogen Corp. v. Biocrest Mfg., L.P.*, 327 F.3d 1364, 1370 (Fed. Cir. 2003). Here, the preamble was amended during prosecution to obtain allowance of Claim 41. The law is clear that reliance on the preamble to gain allowance of a claim “transforms the preamble into a claim limitation because such reliance indicates use of

1 the preamble to define, in part, the claimed limitation.” *Invitrogen*, 327 F.3d at 1370 (quoting
2 *Catalina Mktg. Int’l, Inc. v. Coolsavings.com, Inc.*, 289 F.3d 801, 808-09 (Fed. Cir. 2002)). The
3 preamble also recites that the “transmission system” performs all the operative steps of the claim.
4 For this reason as well, the preamble is a limitation of the claim. *See Eaton Corp. v. Rockwell*
5 *Int’l Corp.*, 323 F.3d 1332, 1339 (Fed. Cir. 2003) (holding that a preamble was limiting where
6 claim steps were performed by the structure described in the preamble). Thus, the preamble of
7 Claim 41 is limiting and requires that the *transmission system* perform the steps of the claim.
8

9 **A. The Phrase “Performed by a Transmission System” was Added to the
Preamble of Claim 41 to Gain Allowance.**

10 During prosecution, applicants added Claim 41 by an amendment filed on September 30,
11 1991. *See Declaration of David M. Hymas In Support of Satellite Defendants’ Memorandum Re*
12 *the Definitions of Terms in Claims 41-45 of the ‘992 Patent (“Hymas Decl.”), Ex. A.* As
13 originally written, the preamble did not specify any structure for performing the steps recited in
14 the body of the claim:

15 41. A method of transmitting information to remote locations, the
transmission method comprising the steps of:
16

17 *Id.* at 11.

18 On December 10, 1991, the PTO rejected every pending claim. Claim 41 was rejected
19 over *Abraham ‘806* in view of *Ulicki ‘733*. *Hymas Decl.*, Ex. B at 2-3. Following this rejection,
20 the Applicants held an interview with the Examiner on December 20, 1991. *Hymas Decl.*, Ex. C.
21 Applicants then filed an amendment on December 26, 1991. In the amendment, Applicants made
22 only one change to Claim 41 — they added to the preamble the following phrase: “performed by
23 a transmission system.” The preamble of amended Claim 41 is below, with the added portion in
24 bold:
25

26 41. (Amended) A method of transmitting information to remote
locations, the transmission method comprising the steps, *performed*
by a transmission system, of:
27

28 *Hymas Decl.*, Ex. D at 5.

1 Applicants urged that “the independent Claims 1, 18, 22, 41, 47 and 54, as well as the
2 claims which depend directly or indirectly from these claims, are novel and nonobvious.” *Id.*
3 at 11. In other words, the sole ground for rejection of Claim 41, obviousness, was overcome by
4 this amendment to the preamble. On February 5, 1992, without further change to Claim 41, the
5 Examiner issued a Notice of Allowability. Hymas Decl., Ex. E.

6 As the prosecution history demonstrates, the phrase “performed by a transmission system”
7 was added to Claim 41 to gain allowance of an otherwise rejected claim. Reliance on the
8 preamble to overcome a prior art rejection means that the preamble is a claim limitation. *See*
9 *Invitrogen*, 327 F.3d at 1370 (phrase added during prosecution treated as a limitation); *Strattec*
10 *Security Corp. v. General Auto. Specialty Co.*, 126 F.3d 1411, 1418 (Fed. Cir. 1997) (same);
11 *Jansen v. Rexall Sundown, Inc.*, 342 F.3d 1329, 1333 (Fed. Cir. 2003) (same).

12 Acacia cannot now — thirteen years after the preamble was amended for purposes of
13 patentability — seek a construction that effectively removes the very limitation that was added to
14 gain allowance of the claim. The phrase “performed by a transmission system” is material and,
15 together with the body of the claim, defines the subject matter of Claim 41. For this reason alone,
16 the preamble of Claim 41 should be treated as a limitation.

17

18 **B. The Preamble Limits Claim 41 Because the “Transmission System” is the
19 Structure That Performs the Steps of the Claim and Because the
“Transmission System” was Represented to be Significant in the Petition to
Make Special.**

20 The preamble of Claim 41 requires that the “transmission system” perform the steps of the
21 claim.¹ The Federal Circuit has held that when the structure that performs method steps is
22 described *only* by the preamble, it is an example of “the claim drafter choosing to use both the
23 preamble and the body to define the subject matter of the claimed invention.” *Eaton*, 323 F.3d at
24 1340 (internal citation omitted). In such circumstances, the preamble is a limitation. *Id.* Here, it

25

26 ¹ This Court has already construed the term “transmission system” to mean, “an assembly
27 of elements, hardware and software, that function together to convert items of information for
storage in a computer compatible form and subsequent transmission to a reception system.” July
12, 2004 *Markman* Order (“*Markman I*”) at 28 (attached as Ex. F to the Hymas Decl.).

1 is self-evident that both the preamble and the body define the claim: the preamble specifies the
2 transmission system as the structure for performing all the steps of Claim 41. “[A] claim
3 preamble has the import that the claim as a whole suggests for it.” *Id.* at 1339 (quoting *Bell*
4 *Commc’ns Research, Inc. v. Vitalink Commc’ns Corp.*, 55 F.3d 615, 620 (Fed. Cir. 1995)).
5 Because the preamble is the structure that performs the claim’s steps, the claim as a whole
6 demonstrates that the preamble is limiting.

7 That the preamble serves to define Claim 41 is supported by the patentees’ own view of
8 their invention, as expressed in their June 17, 1991, Petition to Make Special (“PTMS”).² Hymas
9 Decl., Ex. G. A PTMS allows applicants to advance their filings to the front of the filing line
10 upon a showing that they have conducted a pre-examination art search, submitted a copy of
11 closely related prior art references, and pointed out “how the claimed subject matter is
12 distinguishable over the references.” Manual of Patent Examining Procedure, § 708.02 VIII (8th
13 ed. 2001). Statements in a PTMS can be particularly persuasive evidence regarding the meaning
14 of claim terms since those statements are the applicants’ view of their invention in light of the
15 prior art. *See Gentry Gallery, Inc. v. Berkline Corp.*, 134 F.3d 1473, 1477 (Fed. Cir. 1998)
16 (holding that PTMS gave meaning to term “console,” irrespective of the term’s ordinary
17 meaning); *see also Mark I Mktg. Corp. v. R.R. Donnelley & Sons Co.*, 66 F.3d 285, 291-92 (Fed.
18 Cir. 1995) (relying on PTMS to narrow construction of claims).

19 The PTMS included a detailed description of 37 prior art references. The applicants
20 distinguished 16 of these references by pointing out that they did not disclose a “transmission
21 system.” Hymas Decl., Ex. G at 6, 11-12, 16, 18-23. In other words, the applicants argued that
22 their transmission system (and its attendant functions) distinguished the claimed invention from
23 many of the prior art references in the PTMS. For example, the applicants distinguished the Lang
24 reference by arguing that Lang “does not teach or suggest a *transmission system for providing*
25 *information to remote locations* which includes library means for storing items.” *Id.* at 6

26 _____
27 2 The PTMS was filed before the Claim 41 amendment adding the phrase, “performed by
the transmission system.” The Applicants, therefore, recognized the importance of the
“transmission system” to their claimed invention from early on in the prosecution.
28

1 (emphasis added). This statement and the other similar explanations in the PTMS further indicate
2 that the preamble is limiting because the applicants defined their invention by reference to the
3 transmission system's functionality. The asserted novelty of the claimed invention rested on the
4 functions that the *transmission system* performed — functions that included sending information
5 to one of the remote locations as described by the steps of Claim 41.

6 **C. Acacia's Misapplication of Federal Circuit Precedent is Unconvincing.**

7 Acacia relies on *C.R. Bard, Inc. v. M3 Sys., Inc.*, 157 F.3d 1340 (Fed. Cir. 1998), and
8 *Vaupel Textilmaschinen KG v. Meccanica Euro Italia S.P.A.*, 944 F.2d 870 (Fed. Cir. 1991), to
9 argue that the preamble is not limiting. Acacia's reliance on these cases is misplaced.

10 In *Vaupel*, the claim covered a method for forming a plurality of patterned strips using a
11 broad weaving machine including a "breast beam." The court found that the "breast beam" was a
12 reference point to fix the direction of movement of the woven fabric. *Vaupel*, 944 F.2d at 879-80.
13 Although Acacia relies on *Vaupel* to argue that the preamble of Claim 41 should not be a
14 limitation, the Federal Circuit confirmed in a subsequent case that the term "breast beam" *was* a
15 limitation in *Vaupel*:

16 [In *Vaupel* w]e did not conclude, . . . , that the term "breast beam"
17 could be ignored because it appeared in the preamble; in fact, the
18 analysis in *Vaupel* has nothing to do with the issue of whether the
19 preamble was necessary to define a complete invention. Rather, the
20 issue was the proper meaning of the term "breast beam." We
21 agreed with the district court that the term "breast beam" meant "a
reference point to fix the direction of movement of the woven fabric
from the loom" and that this meaning should be applied in the
infringement analysis. Thus, while we concluded that the term
"breast beam" was not a structural limitation of the claims; *it was*
nevertheless a limitation.

22 *Eaton*, 323 F.3d at 1341 (emphasis added). Thus, *Vaupel* undermines Acacia's position.

23 Moreover, the preamble of Claim 41 presents a clearer case of treating the preamble as a
24 limitation than the preamble of *Vaupel*. As explained in the discussion of *Vaupel*, the court in
25 *Eaton* said, "[t]he method claim in *Vaupel* [did] not require that any step of the claimed method
26 be performed by the breast beam." *Id.* In contrast, Claim 41's preamble clearly indicates that the
27 transmission system performs *all* of the steps. *See id.* (distinguishing *Vaupel* on ground that the
28

1 claim in *Eaton* required “the manipulation and operation of structure that is identified and
2 described by the preamble”).

3 *C.R. Bard* also has no application to this case. In *C.R. Bard* the claim at issue was
4 directed to a “biopsy needle.” 157 F.3d at 1348. The preamble read:

5 A biopsy needle *for use with* a tissue sampling device having a
6 housing with a forward end, a first slide mounted for longitudinal
7 motion within said housing, and a second slide mounted for
longitudinal motion within said housing, said biopsy needle
comprising:

8 *Id.* at 1348-49 (emphasis added). The court found that the preamble was not limiting because it
9 served only to provide a reference point for the claimed needle. As the *Eaton* court explained,³
10 the preamble in *C.R. Bard* was “an example of a statement of *intended use* of the claimed
11 invention: the plain language of the preamble states that the biopsy needle is ‘for use with’ the
12 structure described by the remainder of the preamble.” *Eaton*, 323 F.3d at 1341 (emphasis
13 added). Because the plain language of the claim did not require the biopsy needle to couple with
14 the tissue sampling device (the structure disclosed in the preamble), the preamble of *C.R. Bard*
15 was not a limitation. *Id.* at 1342. Here, the preamble of Claim 41 does much more than state an
16 *intended* use of the invention — the “transmission system” is recited to be the structure that
17 actually performs the steps of the claim. Therefore, the reasoning of *C.R. Bard* does not apply
18 here.

19 For all of these reasons, the preamble of Claim 41 is limiting and requires that the steps of
20 the claim be performed by the transmission system.

21 **II. THE STEPS OF CLAIM 41 MUST BE PERFORMED IN SEQUENTIAL ORDER.**

22 It is well-established that the steps of a method patent must be performed in sequential
23 order either when the steps recite an order or when, as here, “the method steps implicitly require
24 that they be performed in the order written.” *Altiris, Inc. v. Symantec Corp.*, 318 F.3d 1363, 1369
25 (Fed. Cir. 2003) (quoting *Interactive Gift Express, Inc. v. Compuserve Inc.*, 256 F.3d 1323, 1342-

26 _____
27 ³ Interestingly, in *Eaton*, the plaintiff relied on *C.R. Bard* and *Vaupel* to make the same
arguments Acacia makes here. The Federal Circuit rejected those arguments and this Court
should do the same.

1 43 (Fed. Cir. 2001)). For claims that do not explicitly recite a specific order, courts look first at
2 whether “as a matter of logic or grammar, [the steps] must be performed in the order written.”
3 *Altiris*, 318 F.3d at 1369.

4 Claim language logically suggests that steps must be performed sequentially when
5 subsequent steps indicate that prior steps have already been performed. *See Mantech Envtl.*
6 *Corp. v. Hudson Envtl. Servs., Inc.*, 152 F.3d 1368, 1375-76 (Fed. Cir. 1998); *Loral Fairchild*
7 *Corp. v. Sony Corp.*, 181 F.3d 1313, 1321-22 (Fed. Cir. 1999) (finding that steps in claim had to
8 be performed sequentially). The language of Claim 41 plainly meets this requirement.

9

10 **A. The Steps of Claim 41 Must be Performed in Order and After Any Prior
Steps are Completed.**

11 Here, logic, grammar, and consistency with the specification require that Claim 41’s steps
12 to be performed in the listed order and that any prior steps be completed before subsequent steps
13 begin. Claim 41 recites the following steps:

14 A method of transmitting information to remote locations, the
15 transmission method comprising the steps, performed by a
transmission system, of:

16 [1] storing items having information in a source material library;

17 [2] retrieving the information in the items from the source material
library;

18 [3] assigning a unique identification code to the retrieved
information;

19 [4] placing the retrieved information into a predetermined format as
formatted data;

20 [5] placing the formatted data into a sequence of addressable data
blocks;

21 [6] compressing the formatted and sequenced data blocks;

22 [7] storing, as a file, the compressed, formatted, and sequenced data
blocks with the assigned unique identification code; and

23 [8] sending at least a portion of the file to one of the remote
locations.

24
25
26
27 ‘992 patent, 24:54-25:5.

28

1 As a matter of simple grammar and logic, the claim's language dictates that the steps must
2 take place sequentially and only after any prior step has been completed. Step 1, the "storing" of
3 "items having information in a source material library," must logically precede and be completed
4 prior to the beginning of step 2, "retrieving" the information from the source material library.
5 Without having previously stored items in the "source material library," there would be nothing in
6 the library to retrieve. Similarly, step 2, the "retrieving" step, must be completed and must
7 precede steps 3 and 4, both of which refer to "retrieved information" in the past tense. Step 3
8 assigns a "unique identification code to the retrieved information." Without "retrieved
9 information" there would be nothing that could be assigned an identification code. Likewise,
10 step 4 requires that there be "retrieved information" prior to placing that information into a
11 "predetermined format as formatted data."

12 The formatting step, step 4, must then be completed prior to steps 5, 6, and 7, all of which
13 refer to "formatted" data, again in the past tense. Absent step 4, there would be no "formatted
14 data" to place into a "sequence of addressable data blocks" in step 5. In the same way, without
15 "formatted data," step 6 could not compress "the *formatted* . . . data blocks," and step 7 could not
16 store "as a file, the . . . *formatted* . . . data blocks."

17 Steps 5 and 6 must occur next. The sequencing step, step 5, must be completed prior to
18 proceeding with steps 6 and 7, both of which refer to "sequenced data blocks" in the past tense.
19 Step 6 could not compress the "sequenced data blocks" if the blocks had not already in fact been
20 sequenced. Nor could step 7 store "sequenced data blocks" prior to step 5's sequencing of the
21 data blocks. The compressing step, step 6, as well as steps 3, 4, and 5, must also be completed
22 and must precede step 7, which can only store data blocks that have been "compressed,"
23 "formatted," "sequenced," and "assigned [a] unique identification code."

24 And finally, the claim language requires step 7, which involves the creation of "a file" for
25 storage, to be completed and to precede step 8, in which "at least a portion of the file" is sent to
26 one remote location. The file created in step 7 consists of "compressed, formatted, and sequenced
27 data blocks with the assigned unique identification code." Logically, such a file can only be
28 created after the steps that compress, format, sequence, and assign an unique identification code

1 to the information have occurred and been completed. Only after the file is created can Step 8
2 send a portion of that file to one of the remote locations.

3 As in *Mantech*, the language of Claim 41 is clear and nothing in the specification suggests
4 otherwise. Indeed, the specification is consistent with the claim's language in requiring the steps
5 to proceed in sequential order and to be completed prior to subsequent steps beginning. For
6 example, the preferred method of distribution by the transmission system, both as described in the
7 specification and Figure 7, discloses the following sequence (with the bracketed numbers
8 referring to the steps recited in Claim 41):

9 [1] a source material library means, '992 patent, 18:53-56;

10 [2] "retrieving the information for selected items [stored] in the
11 source material library," *id.* at 18:53-55;

12 [3] "[a]fter the information for the selected items is retrieved," the
13 distribution method assigns "a unique identification code to the
14 retrieved information," *id.* at 18:60-66;

15 [4] "placing the retrieved information into a predetermined format
16 as formatted data, *id.* at 18:68-19:2;

17 [5] "placing the formatted data into a sequence of addressable data
18 blocks," *id.* at 19:2-4;

19 [6] "compressing the formatted and sequenced data, *id.* at 19:5-7;
and

[7] "storing as a file the compressed sequenced data . . . with the
unique identification," *id.* at 19:7-9.

20 As set forth in Claim 41, the specification explains that a source material library must
21 exist at step 1 before information can be retrieved in step 2. Steps 3 and 4 clearly must occur
22 after step 2 has been completed since the specification uses the term "after," and the steps
23 themselves reference the information retrieved from the source material library during step 2.
24 Step 5 must logically occur after step 4 since it would otherwise be impossible to place
25 "formatted data" into "a sequence of addressable data blocks" unless the data was already
26 formatted. In the same way, step 6 must occur after steps 4 and 5 have been completed because it
27 would otherwise be impossible to compress "formatted and sequenced data" without the data

1 having already been formatted and sequenced. And finally, step 7 stores the data, which has been
2 completely processed during the preceding steps, as a file.

3 Other passages in the specification confirm the sequence of Claim 41 and the fact that its
4 steps must be completed in order as recited. The summary of the invention discloses the same
5 order. *Id.* at 2:26-48. Figure 2a, which is a preferred embodiment of the transmission system,
6 and its accompanying description in the specification also set forth the same sequential order. For
7 example, the specification first describes a source material library into which different types of
8 information, such as television programs, movies, or audio recordings, are deposited. *Id.* at 6:8-
9 34. Consistent with the claim, the specification discloses that Step 4's formatting element occurs
10 "after" step 3's identification encoding. *Id.* at 6:58-62. Obviously, the information must be
11 retrieved, as described by step 2, before either steps 3 or 4 can occur. Step 5's sequencing step
12 then occurs "[a]fter the retrieved information is converted and formatted." *Id.* at 7:64-68. After
13 the data is sequenced, it is prepared for compression and compressed, as outlined by step 6. *Id.* at
14 8:59-62; 9:40-42. And, "after compression processing," the data is placed into a single file and
15 stored. *Id.* at 10:23-26 & 36-39.

16 Any argument that the steps of Claim 41 may be performed simultaneously or out of the
17 recited order ignores the basic principle of patent law that "[t]he specification must teach and
18 enable all the claims." *Phillips v. AWH Corp.*, 415 F.3d 1303, 1325 (Fed. Cir. 2005). "[T]o be
19 enabling, the specification of a patent must teach those skilled in the art how to make and use the
20 full scope of the claimed invention without 'undue experimentation.'" *In re Wright*, 999 F.2d
21 1557, 1561 (Fed. Cir. 1993). Here, the specification not only fails to discuss alternate sequences,
22 it fails to teach that some steps could occur at the same time as other steps. For example, the
23 specification does not teach that formatted data is "partially formatted" before proceeding to
24 subsequent steps nor does it teach that data blocks can be compressed and sequenced at the same
25 time. The specification's failure to even mention that the steps could be performed concurrently
26 is insufficient to teach an individual skilled in the art "how to make and use the full scope of the
27 claimed invention." Instead, consistent with the claim language and as outlined above, the
28 specification teaches that subsequent steps occur only after preceding steps have been completed.

B. Acacia's Attempt to Blur the Sequence of the Claim is Unsupported.

Acacia’s arguments against the language of the claim are unpersuasive. Acacia purports to agree that the steps of Claim 41 proceed in sequential order. However, it also tries to argue that there is no requirement that any step “begins and occurs only after a prior step or steps have been completed,” stating in conclusory fashion — and without citations to the patent or case law — that Claim 41 includes no such limitation. *See* Acacia’s April 17, 2006, *Markman* Brief at 52-53, 58. These positions are inconsistent. If steps could be performed before, during, or after other steps, by definition the claims would not recite a sequential order. Acacia’s argument ignores the plain language of the claim and specification, as detailed above.

Further, the Federal Circuit has rejected Acacia’s argument in similar cases. For example, in *Combined Systems, Inc. v. Defense Technology Corp. of America*, 350 F.3d 1207 (Fed. Cir. 2003), the Federal Circuit had to construe a method claim for non-lethal projectiles, such as those used in police work. At issue was claim language outlining steps that (1) formed “folds” in a projectile body and (2) inserted the “formed folds” of the projectile body into an empty shotgun shell. *Id.* at 1208-09. The district court required that the folds be formed prior to, and not during, insertion into the shotgun shell. *Id.* at 1211. Like Acacia, the patentee argued that the steps could occur concurrently. The Federal Circuit disagreed and affirmed the district court, finding that:

plainly as a matter of grammar, the recitation of "inserting said formed folds . . . into said projectile compartment" forecloses — at least in the absence of compelling evidence to the contrary in the written description or prosecution history — a construction permitting the "folds" to be formed after or during insertion of the projectile into the projectile compartment in the shotgun shell.

Id. at 1211-12 (emphasis added). In other words, according to the plain meaning of the claim terms, the subsequent step could only begin once the prior step had been completed.

In *Mantech* the Federal Circuit applied a similar analysis. *Mantech* involved a method patent for remediating contaminated underground water. The patentee argued on appeal that the steps could be performed simultaneously rather than in the order recited. 152 F.3d at 1370. The Federal Circuit disagreed, finding that before acetic acid could be injected into a well, as described by step 2 of the claim, the well had to first exist, as described by step 1. *Id.* at 1375-76.

1 Likewise, before a “solution of ferrous ion” could be mixed with “said acidified groundwater,”
2 “the acid must have already mixed with the groundwater to form acidified groundwater,” as
3 described by prior steps. *Id.* at 1376.

4 Like *Combined Systems* and *Mantech*, Claim 41 only makes sense, grammatically and
5 logically, when it is read to require preceding steps be completed before the next step begins.
6 Each step refers specifically and in the past tense to the preceding step or steps. A prerequisite to
7 accomplishing each claimed step is the completion of the elements in the preceding step or steps.
8 All the steps must be completed to send “at least a portion of the file to one of the remote
9 locations.” In short, and as the Federal Circuit held in *Mantech*, “the sequential nature of the
10 claim steps is apparent from the plain meaning of the claim language and nothing in the written
11 description suggests otherwise.” *Id.* at 1376.⁴

12 **III. THE PHRASE “ONE OF THE REMOTE LOCATIONS” IN CLAIM 41 SHOULD
13 BE CONSTRUED TO MEAN “ONE AND ONLY ONE OF THE REMOTE
14 LOCATIONS.”**

15 A key limitation in Claim 41 of the ‘992 patent is the requirement that the transmission
16 system send at least a portion of the file “to one of the remote locations.” As the Federal Circuit
17 and district courts have found in construing similar claims, the ordinary meaning of such a phrase
18 is “one and only one” of the remote locations. This definition is confirmed by the specification,
19 by its usage in other claims in the ‘992 patent, and by the prosecution history of a related patent.

20 **A. The Ordinary Meaning of “One” Requires Construing “One of the Remote
21 Locations” to Refer to a Single Remote Location.**

22 When the ordinary meaning of a disputed term is apparent, “claim construction in such
23 cases involves little more than the application of the widely accepted meaning of commonly
24 understood words.” *Phillips*, 415 F.3d at 1314; *see also Vitronics Corp. v. Conceptronic, Inc.*,
25 90 F.3d 1576, 1582 (Fed. Cir. 1996) (claims given ordinary and customary meaning unless
26 otherwise indicated in the specification). In this case, the ordinary and customary meaning of

27 ⁴ For similar reasons, claims 42-45 must be performed as part of the steps of claim 41 in
28 which they are “include[ed],” and not “before, after or simultaneously with” the steps of claim 41,
as Acacia argues. *See* Acacia’s April 17, 2006, *Markman* Brief at 58-62.

1 “one” confirms that “one of the remote locations” means “one *and only one* remote location.”

2 Simply stated, one means one, not “one or more.”

3 When used as an adjective or noun, the term “one” is defined by the *Webster’s Third New*
4 *International Dictionary* to mean “a single unit or entire being or thing *and no more.*”⁵ Hymas
5 Decl., Ex. H at 1575. One of the explanatory examples is illustrative: “there is one apple in the
6 basket.” Thus, if there are three apples in a basket, one would not say that there is “one apple” in
7 the basket. A second definition used by *Webster’s Third New International* is also instructive:
8 “being a particular unit or entire being or thing singled out (as by way of contrast, difference)
9 from two or more identical or similar units or beings or things.” *Id.* It provides the following
10 examples: “spent one day of our vacation exploring the forest;” “have mentioned one important
11 point out of the several that will have to be considered;” and “went from one side to the other.”
12 *Id.* In each of these examples, the term “one” is used to single out a particular. As in these
13 examples, the “one” modifying “remote locations” serves to single out a particular location from
14 other “remote locations” to which information is transmitted.

15 The Federal Circuit has confirmed that this dictionary definition is the ordinary meaning
16 of “one” used in patent claims. In *WMS Gaming, Inc. v. International Game Technology*,
17 184 F.3d 1339 (Fed. Cir. 1999), a claim was directed to a slot machine “comprising” several
18 elements, including a “means for assigning a plurality of numbers” and a “means for randomly
19 selecting *one of said plurality of assigned numbers.*” *Id.* at 1346-47 (emphasis added). The party
20 accused of infringing the patent argued that the phrase “one of said plurality of assigned
21 numbers” was limited to selecting single numbers rather than combinations of numbers. *Id.* at
22 1349-50. The district court disagreed, ruling that there was nothing in the claim that limited
23 generated numbers to a single number. *Id.* at 1349-50. The Federal Circuit reversed. It held that
24 “[t]he plain meaning of ‘selecting one of said … numbers’ is selecting a single number, not a

25 _____
26 ⁵ Other dictionaries provide similar definitions. See, e.g., *The American Heritage*
27 *Dictionary of the English Language*, at 1228-29 (4th ed. 2000) (defining “one” to mean “being a
single entity, unit, [or] object”) (attached as Ex. I to the Hymas Decl.); *Merriam Webster’s*
Collegiate Dictionary, at 811-12 (10th ed. 1998) (defining “one” to mean “being a single unit or
thing”) (attached as Ex. J to the Hymas Decl.).

1 combination of numbers.” *Id.* at 1350. Because nothing in the written description, drawings, or
2 prosecution history indicated a contrary definition, the court held that the disputed term referred
3 to a single number rather than combinations of numbers.

4 *Tulip Computers Internationali B.V. v. Dell Computer Corp.*, 236 F. Supp. 2d 364
5 (D. Del. 2002), also confirms this interpretation. At issue in *Tulip Computers* was a patent claim
6 directed to an “assembly for use in a personal computer.” *Id.* at 368. The claimed assembly
7 “comprised” several elements, including a “riser card.” *Id.* at 368-69. The parties disputed the
8 claim phrase “[w]herein a predefined *one of the positions* on the riser card has both ISA type and
9 PCI type expansion connectors” *Id.* at 396 (emphasis added). There, as here, the patentee
10 argued that the term “one,” as used in the phrase “one of the positions,” meant “one or more.”
11 The patentee further argued, as Acacia does here, that the claim’s “use of the transitional phrase[]
12 ‘comprising’ . . . does not exclude additional elements.” *Id.* The court rejected the patentee’s
13 construction of the term “one,” explaining:

14 Dell’s proposed construction, that ‘a predefined one’ combi-
15 connector position means ‘one *and only one*’ combi-connector
16 position, is not improperly imposing an unstated limitation on the
claims at issue. *Dell’s proposed construction merely applies the*
17 *ordinary and accustomed meaning to the phrase. One means a*
single unit. *One means one.*

18 *Id.* at 397-98 (emphasis added).

19 The analyses of *WMS Gaming* and *Tulip Computers* apply with equal force here. As in
20 *WMS Gaming*, *Tulip Computers*, and the dictionary definitions, the “one” in Claim 41 refers to a
single unit: one and only one.

22 **B. Acacia Offers No Persuasive Reason to Deviate from the Ordinary Meaning
23 of “One.”**

24 Acacia ignores entirely the meaning of the term “one.” Instead, Acacia rewrites the claim,
25 attempts to construe that rewritten claim, and then cites case law relating to the rewritten claim.
26 See Acacia’s April 17, 2006, *Markman* Brief at 53-56. In particular, Acacia asserts without any
27 support that “[t]he term ‘one’ is used in this portion of the claim in the same manner that the term
‘a’ would be used, and therefore the term should be construed to mean ‘one or more.’” *Id.* at 54.
28

1 Acacia goes on to rely on cases that interpret patent claims that include the term “a” or “an”
2 rather than the term “one.” *Id.* at 54-56. Indeed, Acacia fails to cite *any* cases that actually
3 construe “one.” Of course, the case law Acacia does cite is entirely irrelevant to the actual claim
4 language. *See Chef Am., Inc. v. Lamb-Weston, Inc.*, 358 F.3d 1371, 1374 (Fed. Cir. 2004) (“[I]n
5 accord with our settled practice we construe the claim as written, not as the patentees wish they
6 had written it.”).

7 Acacia’s proposed construction of “one” additionally ignores the fact that the article “a” is
8 used to modify numerous other terms in Claim 41. Indeed, immediately preceding the term
9 “one,” the patentees use “a” to modify “portion of the file.” A simple canon of claim
10 construction dictates that “the use of both terms in close proximity in the same claim gives rise to
11 an inference that a different meaning should be assigned to each.” *Bancorp Servs., L.L.C. v.*
12 *Hartford Life Ins. Co.*, 359 F.3d 1367, 1373 (Fed. Cir. 2004); *see also Innova/Pure Water, Inc. v.*
13 *Safari Water Filtration Sys., Inc.*, 381 F.3d 1111, 1119 (Fed. Cir. 2004) (“[W]hen an applicant
14 uses different terms in a claim it is permissible to infer that he intended his choice of different
15 terms to reflect a differentiation in the meaning of those terms.”). Thus, “one” *cannot* mean the
16 same thing as “a.” Acacia’s approach turns Federal Circuit case law on its head by assigning the
17 *same* meaning — rather than a different one — to different terms.

18 The mistake in Acacia’s approach is particularly glaring because it uses *Webster’s Third*
19 *New International Dictionary* — the *same* dictionary that the Satellite Defendants use to define
20 “one” — to define other terms in the ‘992 and ‘275 patents. *See* Decl. of Alan Block, Exs. 1-3, 5-
21 6. Given the definition of “one,” Acacia’s failure to provide a dictionary definition of the term
22 that actually appears in this claim is understandable.

23

24 **C. The Specification Confirms the Ordinary Meaning of “One of the Remote
Locations.”**

25 Nothing in the specification supports a contrary meaning of the phrase “one of the remote
26 locations.” Acacia points to “a number of embodiments in which the file or portion of the file is
27 sent to at least one remote location.” Acacia’s April 17, 2006, *Markman* Brief at 54. Acacia
28 ignores, however, several embodiments which are explicitly limited to sending files or portions of

1 files to *one and only one* of the remote locations. Thus, the specification is fully consistent with
2 construing Claim 41 to be limited, like many of the disclosed embodiments, to sending a file to
3 only one location.

4

5 **1. The Specification Discloses Numerous Embodiments that Describe
Singular, Rather Than Plural, Remote Locations.**

6 The specification discloses numerous embodiments — both those that require user input
7 and those that do not — that refer to particular, distinct remote locations. For example, Figure 1a
8 discloses a transmission system connected to a single reception system. In addition, the
9 patentees’ “Summary of the Invention” describes the invention as a “transmission and receiving
10 system for providing information to remote locations.” ‘992 patent, 2:28-29. The final element
11 of the embodiment in the summary of the invention is a “transmitter means, coupled to the
12 compressed data storing means, for sending at least a portion of a specific file to a *specific one of*
13 *the remote locations.*” *Id.* at 2:46-48 (emphasis added). This embodiment is consistent with the
14 Satellite Defendants’ proposed construction.

15 Similarly, at least two of the embodiments described in the specification describe
16 transmitting to a specific, particular remote location. For example, Figure 7 describes “a
17 preferred method of distribution.” Steps 416 and 417 of Figure 7 limit the method to sending and
18 receiving data at a singular “remote location.” In further describing Figure 7, the specification
19 refers to singular, rather than multiple, remote locations. It discloses a preferred embodiment
20 that, as part of step 417, converts compressed formatted data “for output *to a reception system*
21 *200, selected by the user . . .* The requested information is then payed [sic] back *to the reception*
22 *system 200 of the user* at the time requested by the user (step 419).” *Id.* at 19:23-36 (emphasis
23 added). This description discloses a method whereby the user selects information for
24 transmission. That information is eventually transmitted to the user’s reception system at the
25 remote location selected by the user, an interpretation consistent with the singular construction of
26 remote location.

27 Thus, the Satellite Defendants’ proposed construction is fully consistent with several
28 embodiments described in the specification.

2. The Specification Does Not Provide a Special Meaning for the Term “One.”

“[T]he specification may reveal a special definition given to a claim term by the patentee that differs from the meaning it would otherwise possess.” *Phillips*, 415 F.3d at 1316. “If a divergent specialized usage were intended, the context was such that it was required to be clearly explained in the patent documents.” *Kustom Signals, Inc. v. Applied Concepts, Inc.*, 264 F.3d 1326, 1331 (Fed. Cir. 2001). Here, the specification does not “reveal a special definition” for the term “one.” Thus, the specification provides no basis to depart from the plain and ordinary meaning of the term “one of the remote locations.”

D. Language from Other Claims Confirms the Meaning of “One of the Remote Locations.”

The patentees knew how to claim multiple elements and did so when appropriate. Claims 6, 21, 45, and 47 of the ‘992 patent all include the modifier “plurality” to distinguish singular from plural elements. The term plurality means “comprising, or consisting of more than one.” *Bowers v. Baystate Techs., Inc.*, 320 F.3d 1317, 1332 (Fed. Cir. 2003) (quoting *The Oxford English Dictionary* (2d ed. 1989)). Also illustrative is the use of the modifier “at least.” For example, Claims 6, 22, 25, and 54 use the phrase “at least one” to describe various elements. Indeed, Claim 41 uses the modifier “at least a portion” immediately preceding the phrase “one of the remote locations.” Claims 1, 19, and 47 also use this modifier to describe various plural elements. “Use of the phrase ‘at least one’ means that there could be only one or more than one.” *Rhine v. Casio, Inc.*, 183 F.3d 1342, 1345 (Fed. Cir. 1999).

In sharp contrast to such language as “at least” and “plurality,” the final clause of Claim 41 refers to “one of the remote locations.” When a patent uses both singular and plural language in different claim elements, that difference should not lightly be disregarded. *See, e.g.*, *Interactive Gift*, 256 F.3d at 1334 (“Although the single element of Claim 37 initially mentions material objects in the plural, it is later modified by a singular reference and does not require more than one material object.”); *Tulip Computers*, 236 F. Supp. 2d at 397-98 (comparing use of the modifier “at least” to give effect to singular term “one”). As in *Tulip Computers*, when the

1 patentees wanted to describe plural elements in the ‘992 patent’s claims, they used words to that
2 effect.⁶ This point is particularly compelling given the patentees’ use of the term “one,” rather
3 than other obvious references to multiple elements, in the phrase “one of the remote locations.”
4 “It is settled law that when a patent claim does not contain a certain limitation and another claim
5 does, that limitation cannot be read into the former claim in determining either validity or
6 infringement.” *SRI Int’l v. Matsushita Elec. Corp. of Am.*, 775 F.2d 1107, 1122 (Fed. Cir. 1985).

7 Like Claim 41, Claims 1, 19, and 47, also use the plural “remote locations” in their
8 preambles to describe a plurality of sites. And like Claim 41, each of these claims also uses the
9 phrase “one of the remote locations” in the claim language. This use distinguishes the singular
10 phrase “one of the remote locations” from the plural phrase “remote locations” in the preambles.
11 *See Interactive Gift*, 256 F.3d at 1334 (distinguishing “generality” of preambles’ references to
12 multiple elements from claims’ more specific, singular references to the same elements).
13 Acacia’s argument that the preamble’s reference to “remote locations” gives meaning to the
14 singular “one of the remote locations” fails to account for the actual language of the claim and is
15 flatly contrary to the Federal Circuit’s instruction in *Interactive Gift*.

16
17 **E. The Prosecution History of the ‘863 Patent Confirms that the Phrase “One of
the Remote Locations” Points to a Single, Particular Remote Location.**

18 The prosecution history of the ‘863 patent confirms the Satellite Defendants’ proposed
19 construction. The ‘863 patent is related to the ‘992 and ‘275 patents. Specifically, the application
20 that issued as the ‘863 patent was a continuation of the application that issued as the ‘275 patent,
21 which was in turn a continuation of the application that issued as the ‘992 patent. All three
22 patents share the same specification. During the prosecution of the application leading to the
23 ‘863 patent, and in response to a prior art rejection by the PTO, the patentees distinguished their
24 claims for providing information to “remote locations” by explaining that they taught a system

25
26

⁶ Indeed, Claim 10 of the ‘863 patent, which is from the same patent family tree as the
27 ‘992 and ‘275 patents and which also uses the same specification, claims a transmitter means for
transmitting a file “to at least one of a plurality of the remote locations” in obvious contrast to the
singular “one” used in Claim 41. Hymas Decl., Ex. K at 21:16-17.

1 that provided information to “one of a plurality of remote locations,” *i.e.*, “a *single* remote
2 location.”

3 Included with a May 13, 1994, Amendment to the ‘863 application were new Claims 21
4 and 22 (eventually renumbered 33 and 34), which disclosed a “transmission system for providing
5 information to be transmitted to remote locations.” Hymas Decl., Ex. L at 1-2. Claim 33
6 included a “transmitter means,” which, coupled to the conversion means, provided “for
7 coordinated transmission of the formatted data to *one of the remote locations.*” *Id.* Dependant
8 Claim 34 disclosed “a transmission system as recited in claim [33], wherein the plurality of
9 libraries are geographically separated.” *Id.* at 2.

10 After an initial rejection, on December 30, 1994, the examiner again rejected Claims 33
11 and 34. Hymas Decl., Ex. M at 1. The examiner explained that both claims were anticipated by
12 Ballantyne, *et al.*’s patent disclosing a method and apparatus for distributing movies. *Id.* at 4-5.
13 (The Ballantyne reference is dated August 28, 1990, before Acacia’s earliest filing date. Hymas
14 Decl., Ex. N.) In a May 30, 1995, response, the applicants responded to the rejection by arguing
15 that Ballantyne failed to disclose:

16 the claimed identification encoding means for retrieving
17 information in items from a plurality of library means and
18 transmitter means for transmission of formatted data from a
19 plurality of libraries *to one of a plurality of remote locations.*

20 Ballantyne et al. further fail to even remotely suggest collecting
21 information from a plurality of geographically separated libraries
22 for transmission to *a single remote location* as recited in claim 34.
23 Hymas Decl., Ex. O at 5 (emphasis added). Thus, the applicants argued that Ballantyne did not
24 anticipate because it did not disclose transmissions to a “single remote location” among the
25 plurality of remote locations. Claim 1 of the issued ‘863 patent contains the same “one of the
26 remote locations” language that was in prosecution Claim 33 and, by extension, in dependent
27 Claim 34.⁷ Hymas Decl., Ex. K at 19:52.

28
29

⁷ While prosecution Claims 33 and 34 were never issued, Claim 1 of the ‘863 patent
30 includes the same phrase “one of the remote locations.” Hymas Decl., Ex. K at 19:52.

1 The ‘863 prosecution history confirms the Satellite Defendants’ proposed construction.
2 Both Claim 1 of the ‘863 patent and Claim 41 of the ‘992 patent include the general reference to
3 “remote locations” in their preambles.⁸ This general reference is modified by the phrase “one of
4 the remote locations” in the final claim limitation. When pressed during prosecution on the
5 meaning of the phrase “one of the remote locations” in light of relevant prior art, the patentees’
6 explanation reinforces the conclusion that the phrase refers to one *and only one* location. The
7 meaning of the statements “one of a plurality” and “a single remote location” is plain: the
8 patentees limited the phrase “one of the remote locations” to one and only one remote location.

9 When patents “all derive from the same parent application and share many common
10 terms, [courts] must interpret the claims consistently across all asserted patents.” *NTP, Inc. v.*
11 *Research in Motion, Ltd.*, 418 F.3d 1282, 1293 (Fed. Cir. 2005); *see also Epcon Gas Sys., Inc., v.*
12 *Bauer Compressors, Inc.*, 279 F.3d 1022, 1031 (Fed. Cir. 2002). Moreover, a later-filed patent’s
13 prosecution history may be relevant to a prior-filed patent’s claim terms when the two patents
14 share the same specification. *See Microsoft Corp. v. Multi-Tech Sys., Inc.*, 357 F.3d 1340, 1349-
15 50 (Fed. Cir. 2004). In *Microsoft*, the court rejected the patentee’s argument that subsequent
16 prosecution history statements should not apply to prior patents, explaining that “[a]ny statement
17 of the patentee in the prosecution of a related application as to the scope of the invention would
18 be relevant to claim construction.” *Id.* at 1350. Moreover, there, as here, “the relevance of the
19 statement [was] enhanced by the fact that it was made in an official proceeding in which the
20 patentee had every incentive to exercise care in characterizing the scope of its invention.” *Id.*

21 In its 2004 *Markman* order, the Court interpreted *Microsoft* to prevent application of a
22 subsequent Yurt patent’s prosecution history to the ‘992 patent’s terms where: (1) the patentees’
23 comments were directed toward claim amendments, as opposed to interpreting the specification,
24 and (2) the prior art leading to the comments post-dated the ‘992 priority date. *Markman I* at 7.

25
26

⁸ Claim 10 of the ‘863 patent confirms that the patentee used the appropriate plural
27 language when it claimed transmitting to *more than one* remote location. In sharp contrast to
28 Claim 41 of the ‘992 patent, Claim 10 of the ‘863 patent recites transmitting “*to at least one* of a
29 plurality of the remote locations.” Hymas Decl., Ex. K at 21:16-17.

1 Here, neither condition is present. As in *Microsoft*, the patentees' comments relate to the scope of
2 the invention, as they viewed the invention in light of prior art, and not to any amendments in
3 response to that prior art. *See Microsoft*, 357 F.3d at 1349 & n.5. In addition, the Ballantyne
4 priority date, August 28, 1990, pre-dates the January 7, 1991, priority date of the '992 patent.
5 Consideration of the '863's prosecution history is, therefore, both appropriate and consistent with
6 the *Microsoft* decision.

7 The patentees' use of the phrase "one of the remote locations" in the '863 patent is
8 consistent with their use of the phrase in the '992 patent. The patentees' explanation is also
9 consistent with the common and ordinary meaning of the term "one." Like *Microsoft*, the Court
10 should "take the patentee[s] at [their] word" and should not construe Claim 41 "more broadly
11 than the patentee[s] clearly envisioned." *Id.* at 1350.

12 **IV. THE TERM "ITEMS" HAVING [OR CONTAINING] INFORMATION"
13 SHOULD BE CONSTRUED TO MEAN "PHYSICAL OBJECTS ON WHICH
14 INFORMATION IS STORED."**

15 In its *Markman I* Order, the Court construed the phrase "items containing information" to
16 mean "items containing information in analog or digital form." The Satellite Defendants do not
17 take issue with that construction, so far as it goes. But it has become apparent that there is an
18 unanticipated ambiguity in that construction: the meaning of "item" as it is used in this phrase,
19 which the Court did not construe.⁹

20 The Satellite Defendants propose that the term "items" having or containing information
21 be construed to mean "physical objects on which information is stored, such as videotapes and
22 laser disks." Acacia relies on a general dictionary and proposes that an item containing
23 information is a "thing" containing information. But such a construction is so broad as to be
24 meaningless.¹⁰ Dictionary definitions of common words should not be used in place of the patent

25 ⁹ The Satellite Defendants have no objection, however, if the Court defers consideration of
26 this term to the August 11, 2006 *Markman* hearing so that it may be heard in conjunction with
27 issues raised by the Round 3 Defendants, who have indicated that they will seek a reconsideration
28 of the phrase "items containing (or having) information."

29 ¹⁰ Acacia argues that "[t]he term 'item' is an example of a term in which the ordinary
30 meaning, as understood by persons of ordinary skill in the art, should be readily apparent."
31 Acacia's April 17, 2006, *Markman* Brief at 16. This argument is curious because Acacia, during
32 (Footnote continues on next page.)

1 itself in defining claim terms. *See Toro Co. v. White Consol. Indus., Inc.*, 199 F.3d 1295, 1299
2 (Fed. Cir. 1999). The Court cannot look at the meaning of a term in a vacuum; it must construe
3 terms in the context of the intrinsic record. *See Phillips*, 415 F.3d at 1314. Here, the context
4 dictates that “items having [or containing] information” should be defined as “physical objects on
5 which information is stored.”

6 The ‘992 patent specification uses the term “item” in multiple ways, sometimes referring
7 to physical objects, and sometimes referring to information. But here, where the claims are
8 specifically describing items *that contain information*, the only logical conclusion is that the
9 items are physical ones.

10

11 **A. The Context of Claim 41 Requires Defendants’ Construction of “Items
Having [or Containing] Information.”**

12 In the context of Claim 41, “items having information” are stored “*in a source material
library*.” Thus, we turn to the relevant portion of the specification that defines “items” in that
13 context:

14

15 Transmission system ... of the present invention ... includes source
16 material library means for temporary storage of *items* prior to
conversion and storage in a compressed data library....

17

18 As shown in FIG. 2a, the source material library means included in
19 transmission system 100 preferably includes a source material
library 111. The source material library 111 may include different
20 types of materials including television programs, movies, audio
recordings, still pictures, files, books, computer tapes, computer
disks, documents of various sorts, musical instruments, and other
21 physical objects. These materials are converted to or recorded on a
media format compatible to the digital and analog inputs of the
22 system prior to being compressed and stored in a compressed data
library 118. The different media formats preferably include digital
23 or analog audio and video tapes, laser disks, film images, optical
disks, magnetic disks, computer tapes, disks and, [sic] cartridges.

24 ‘992 patent, 5:66-6:22.

25 (Footnote continued from previous page.)

26 *Markman I*, proposed that “item” should mean “units or members of a group or groups which
27 have information.” Hymas Decl., Ex. P at 23. Thus, even Acacia concedes that there is no
ordinary meaning of this term in the context of the Yurt patents.

1 The above quote teaches one skilled in the art that the source material library includes
2 “different types of materials,” each of which is a physical object: “television programs, movies,
3 audio recordings, still pictures, files, books, computer tapes, computer disks, documents of
4 various sorts, musical instruments, and other physical objects.” Indeed, by specifying “other
5 physical objects” at the end of this list, the patent makes it clear that all of the members of the list
6 are physical objects. These items are then converted to or recorded on a media format that is
7 compatible with the inputs of the transmission system, before the converted or recorded material
8 is compressed and stored in a compressed data library. *Id.* Therefore, in the context of Claim 41,
9 “items” in the source material library means “physical objects on which information is stored,
10 such as videotapes or laser disks.”

11

12 **B. Acacia’s Proposal to Define “Items” Having or Containing Information as a
“Thing” is Unavailing.**

13 Acacia’s argument is essentially this: because the specification describes some items in
14 the source material library that are not physical objects, “items” should not be limited to physical
15 objects. Rather, “items” must be defined as “things.” The claims and the specification, however,
16 do not support Acacia’s argument.

17 Acacia first contends that the specification states that “items” may be “analog and digital
18 audio and video information.” Acacia’s April 17, 2006, *Markman* Brief at 19. But the portion of
19 the specification Acacia relies on actually says “items *of* information may include analog and
20 digital audio and video information.” ‘992 patent, 6:2-3 (emphasis added). There is a difference
21 between “items *of* information” and “items containing [or having] information.” The former self-
22 defines items as information; the latter must be different from the “information” in order to
23 contain items.¹¹

24

25 ¹¹ Acacia’s argument is also contrary to the specification, which makes clear that the
26 “source material library” is a place that can “include different types of materials,” ranging from
27 books, to musical instruments, to video tapes. It is not a computer file server, which can only
28 store digital information. It is a library, in the everyday sense of a physical place where media
and other physical objects of many different types — not disembodied “information” — are kept.

1 Further, Acacia's proposal that an "item" can be *analog and digital audio and video*
2 *information* would lead to a nonsensical result. As noted above, the Court has already construed
3 the phrase "items containing information" to mean "items containing *information in analog or*
4 *digital form*," which Acacia has not challenged. Thus, taking Acacia's assertion at face value,
5 and combining it with the Court's prior construction, Acacia wants the phrase "items containing
6 information" to be capable of meaning "analog and digital audio and visual information
7 containing information in analog or digital form." This definition is completely recursive and
8 makes no sense: information does not contain information.

9 The plain language of Claim 41 requires "information" to be contained in the "items."
10 The first step of the claim reads: "*storing items having information* in a source material library."
11 Therefore, Acacia's argument that "items" can be "information" must be rejected. As to
12 Claim 41, "information" and "items" cannot have the same meaning.

13 Acacia next argues that "items" may be "files." Acacia's April 17, 2006, *Markman* Brief
14 at 19. Here, Acacia appears to be arguing that an "item" can be a computer file. But the portion
15 of the specification on which Acacia relies is clearly not referring to computer files, but files as
16 "physical objects," *i.e.*, folders that contain papers. The specification states that the source
17 material library may include "files, books, computer tapes, computer disks, documents of various
18 sorts, musical instruments, and *other physical objects*." '992 patent, 6:13-15 (emphasis added).
19 Thus, "files," in this context, refers to *physical* files. This construction is confirmed by the fact
20 that the specification states that these "files" must be "converted to or recorded on a media
21 compatible to the digital and analog inputs of the system . . ." *Id.* at 6:15-19. The "file" in this
22 context is clearly not a computer (*i.e.*, digital) file, or it would not have to be converted into
23 digital information.¹²

24 ¹² Claim 41 distinguishes between an "item having information" and a "file." It describes
25 a method for: (a) retrieving information from an "item having information," (b) processing the
26 information into compressed, formatted, and sequenced data blocks, and (c) storing those data
27 blocks as a "file." Acacia's attempt to equate "items having information" with "files" is contrary
28 to the rule that different words used in the same claim have different meanings, as well as the
entire point of Claim 41 — generating a "file" from an "item having information in a source
material library."

1 Finally, Acacia argues that because Claim 25 supposedly refers to an “item” as a
2 “compressed formatted data block,” it would be inconsistent to construe the term “item” to mean
3 a physical object. Acacia’s April 17, 2006, *Markman* Brief at 19-20. But Claim 25 refers to the
4 converted “information” as the compressed formatted data block — not the “item.” In relevant
5 part, Claim 25 provides for a system including “an item stored in a source material library at a
6 transmission system . . . , the item containing *information to be sent from the transmission*
7 *system.*” ‘992 patent, 23:13-19 (emphasis added). The claim includes a “transceiver means . . .
8 for receiving the item from the transmission system *as* at least one compressed, formatted data
9 block.” *Id.* at 23:23-25 (emphasis added). Thus, the natural reading of Claim 25 is that the
10 “information to be sent,” extracted from the “item,” is converted into compressed, formatted data
11 blocks, and in this form, sent *as* the “item.”

12 Acacia’s interpretation of Claim 25 equating “items” with compressed data blocks is also
13 inconsistent with the disclosure in the specification, which repeatedly states that “compressed
14 formatted data blocks” are stored in the “compressed data library,” not the “source material
15 library.” *See, e.g., id.* at 6:8-47; 10:31-45. If the claim drafter intended to mean that the “item”
16 itself was to be compressed, Claim 25 would not have introduced the “information” that is
17 contained in the “item,” and the claim would have read, “transceiver means . . . for receiving the
18 compressed, formatted item from the transmission system.” Therefore, the use of the term “item”
19 in Claim 25 is consistent with the Satellite Defendants’ proposed construction that “items” should
20 mean “physical objects on which information is stored, such as a videotapes and laser disks.”

21 Apart from the intrinsic support that the “items” are physical objects, Acacia’s own
22 statements confirm that “items” are physical objects. In its *Markman I* Opening Claim
23 Construction Brief, Acacia acknowledged that “items” are media that contain information:

24 In the context of the ‘992 patent, the information is in items, and the
25 items are different media types which may be stored in the library
26 means: “The different media formats preferably include digital or
27 analog video tapes, laser disks, film images, optical disks, magnetic
28 disks, computer tapes, disks, and cartridges.” (‘992 patent, 6:19-
22).

28 Hymas Decl, Ex. P at 26. In the same brief Acacia also stated:

1 As discussed above, the items containing information are described
2 in the specification as having different media types which may be
3 stored in the library means: “The different media formats
4 preferably include digital or analog video tapes, laser disks, film
5 images, optical disks, magnetic disks, computer tapes, disks, and
6 cartridges.” (‘992 patent, 6:19-22).

7 *Id.* at 29.

8 For all of these reasons, the term “items” should be construed to mean “physical objects
9 containing information, such as videotapes or laser disks.”

10

11 **V. THE TERM “ADDRESSABLE” REQUIRES THAT THERE BE A KNOWN
12 ASSOCIATION BETWEEN A DATA BLOCK AND ITS STORAGE LOCATION.**

13 The Satellite Defendants propose that the term “addressable,” which modifies “data
14 blocks” in Claim 41, means “that there is a known association between each data block and its
15 storage location so that the transmission system can retrieve any individual data block by using its
16 storage location.”¹³ Acacia proposes that it means “the ability to locate data blocks within an
17 item anywhere in the system using relative time markers that have been assigned to the data
18 blocks.” Acacia’s proposal, however, is flawed for the following reasons:

19

- 20 • Acacia’s definition is overbroad because it only requires the “ability” to retrieve
21 data blocks. Therefore, the definition covers systems that do not actually perform
22 the claimed steps;
- 23 • Its definition is imprecise because it does not require that there be a known
24 association to a storage location. Thus, it covers processes unrelated to
25 addressability;
- 26 • Its definition provides addressability to be “anywhere in the system.” This
27 construction is unsupported by the specification; and

28

29 ¹³ The Round 3 Defendants state that “sequence of addressable data blocks” is a term
30 which has already been construed. The Satellite Defendants, however, are not requesting
31 reconsideration of the Court’s prior rulings. Rather, “addressable” is a new term that requires
32 separate construction. Thus, it is appropriately considered now. The Satellite Defendants have
33 no objection, however, if the Court defers consideration of this term to the August 11, 2006,
34 hearing so that it may be heard in conjunction with issues raised by the Round 3 Defendants, who
35 have indicated that they will seek a reconsideration of the phrase “sequence of addressable data
36 blocks.”

1 • Its definition provides “data blocks” to be within the “item.” This is contrary to
2 the plain language of Claim 41.

3 These issues are discussed separately below.

4

5 **A. The Transmission System Must Have a Known Association to Retrieve the
6 Data Blocks; Mere Ability is Not Enough.**

7 Acacia proposes that the transmission system simply have the “ability” to retrieve data
8 blocks. But such an unrestricted construction expands the definition to include processes that
9 have nothing to do with retrieving data blocks from a storage location, but that *could* be modified
10 to perform that function. This cannot be. A party can be liable only if he practices the steps of
11 the patent claim. *See* 35 U.S.C. § 271(a) (“whoever without authority makes, uses, offers to sell,
12 or sells any patented invention . . . infringes the patent.”).

13 The language of Claim 41 provides that the transmission system actually retrieve the
14 addressed data block from a storage location — not just have the “ability” to do so. Claim 41
15 requires that the transmission system processes formatted data to create a “sequence of
16 addressable data blocks.” The “storing” step provides that these “data blocks” are stored as a file.
17 The phrase reads: “storing, as a file, the compressed, formatted, and sequenced data blocks with
18 the assigned unique identification code.” ‘992 patent, 25:1-3. Finally, the “sending” step
19 requires that “at least a portion of the file” is sent to one of the remote locations: “sending at least
20 a portion of the file to one of the remote locations.” *Id.* at 25:4-5. Therefore, the transmission
21 system of Claim 41 sends data blocks, *i.e.*, a portion of the file, to one of the remote locations.
22 Before sending, the “data blocks” *must* necessarily be retrieved from the *stored* file.

23 Therefore, the transmission system of Claim 41 must have an architecture such that a data
24 block *can* be retrieved from its storage location using a known association. Claim 41 does not
25 cover a system that simply marks data blocks, with no architecture in place for retrieving the data
26 blocks, even if such an architecture *may* be implemented.

1 **B. “Addressable” Means that There is a Known Association Between a Data**
2 **Block and its Storage Location.**

3 Acacia proposes that “addressable” means only to “locate.” But this is inadequate. To be
4 “addressable” there must be a known association to a storage location to retrieve the data blocks.
5 By omitting this critical limitation, Acacia’s definition unduly expands patent protection beyond
6 what should be afforded by the ‘992 patent. Such an unrestricted definition may cover common
7 processes for managing data such as filtering, sorting, scanning, or searching. Yet, no one skilled
8 in the art would call these processes “addressing” or “addressable.” The claim language, the
9 written description, and relevant dictionaries all support the conclusion that to be “addressable,”
10 there must be a known association between the data block and its storage location.

11 The logic of Claim 41 shows that the “addressable” data blocks must be addressed *by their*
12 *storage location*. As discussed above, Claim 41 describes a method of: (a) processing
13 information into a sequence of addressable data blocks; (b) compressing and storing the data
14 blocks as a file; and (c) sending “at least a portion of the file.” Therefore, the transmission
15 system of Claim 41 must send data blocks, *i.e.*, a portion of the file. Before sending, the “data
16 blocks” must first be retrieved from the *stored* file. Thus, addressability is necessary to retrieve
17 data blocks from the stored file.

18 The specification uses “addressable” or “addressing” to mean a known association
19 between an element and its storage location for the purpose of locating the element. For example,
20 the specification describes “addressing” as an association between a song number and the starting
21 frame number of the song so that it may be located from a storage location in the compressed data
22 library. In this way, the song is “addressable”:

23 User and system *addressing requirements* dictate the level of
24 granularity available to any particular section of the system.... For
25 example, a user may desire to listen to a particular song. They may
26 preferably enter the *song number* ... when requesting the item from
27 the compressed data library 118.... Internal to the system, the song
28 is *associated* with a *starting frame number*, which was indexed by
29 the system operator via the *storage encoding process*.... The
30 frames are a subset of, and are contained within, *the items stored in*
31 *the compressed data library 118*.

32 ‘992 patent, 8:32-50 (emphasis added).

1 The specification also provides that a file, stored in the compressed data storing means, is
2 addressable through its unique identification code associated with the file for the purpose of
3 locating that file:

4 the transmission system 100 may further comprise compressed data
5 storing means, coupled to the compression means, for *storing* as a
6 *file* the compressed sequenced data with *the unique identification*
7 *code* received from the data compression means.... The file is
8 *addressable* through the unique identification code assigned to the
9 data by the identification encoder.

10 *Id.* at 10:18-30 (emphasis added).

11 The specification further provides that stored items are addressable through their unique
12 address code, frame number, and the library system address, associated with the items to locate
13 the desired item:

14 *Stored* items are preferably accessed in compressed data library 118
15 through a *unique address code*. The unique address code is a file
16 address for uniquely identifying the compressed data items stored in
17 the compressed data library section of a library system. This file
18 address, combined with the *frame number*, and the *library system*
19 *address* allow for complete *addressability* of all items stored in one
20 or more compressed data libraries 118.

21 *Id.* at 10:46-57 (emphasis added).

22 Therefore, the specification demonstrates that the term “addressable” describes the ability
23 to locate an element by employing a known association with a storage location so that the element
24 sought can be located and retrieved.

25 Technical dictionaries also support this definition. IEEE defines “address” to mean “an
26 identification, as represented by a name, label, or number, for a register, location in storage, or
27 any other data source or destination such as the location of a station in a communication
28 network,” or “a character or group of characters that identifies a register, a particular part of
storage, or some other data source or destination.”¹⁴ Hymas Decl, Ex. Q at 23. In a second
reference, “address” is defined as “the term most generally used to refer (in some way) to a

29 ¹⁴ Because the definition of “addressable” in Claim 41 modifies the term “data blocks,”
30 the dictionary’s definition that “address” may mean an identification of a destination in a
31 communication network does not apply in this case.

1 location within the computer memory; the word *location* is actually used as a synonym. Such
2 reference is usually made for the purpose of retrieving or storing some information at that
3 location.” Hymas Decl., Ex. R at 7. The same reference also defines “addressable location” as,
4 “[a] location whose position in a storage medium is precisely defined and can be accessed.” *Id.* at
5 9. Therefore, the term “address,” and consequently, “addressable” are storage properties,
6 integrally coupled with a storage location.

7 The claim, the specification, and relevant technical dictionaries support defining
8 “addressable” to mean “that there is a known *association between each data block and its storage*
9 *location* so that the transmission system can retrieve an individual data block by using its storage
10 location.”

11 **C. Addressability Must be Within the Transmission System.**

12 Acacia also proposes that “addressable” means “to locate data blocks . . . *anywhere in the*
13 *system . . .*” This proposal is incorrect. The specification clearly provides that addressability of
14 data blocks must be in the *transmission* system. For example,

15 Time encoding by time encoder 114 makes items [sic] and subsets
16 of items retrievable and *addressable* throughout the *transmission*
system.

17 ‘992 patent, 8:50-52 (emphasis added). Other portions of the specification consistently describe
18 locating elements in the compressed data library 118, which, as illustrated in Fig. 2a, is located in
19 the transmission system. *See id.* at 8:32-52; 10:18-30; & 10:46-57. Indeed, this is the logical
20 consequence of the steps of Claim 41 — the transmission system places the data blocks into
21 addressable form, stores the addressable data blocks, then sends the data blocks to one of the
22 remote locations. In view of the language of Claim 41 and the written description, the term
23 “addressable” must refer to addressability within the *transmission system*.

24 **D. The Data Blocks Cannot be “Within” the Items.**

25 Equally unconvincing is Acacia’s proposed definition that would require that the “data
26 blocks” be “*within* an item.” This proposal is inconsistent with the claim language. The language
27 of Claim 41 defines the relationship between items and data blocks: “items” contain
28 “information.” The “information” retrieved from the “items” is identified, formatted, and placed

1 into a “sequence of addressable data blocks.” The data blocks are then compressed and stored as
2 a “file.” Therefore, “data blocks” are in the “*file*.” The “data blocks” are made up of information
3 extracted *from an item*; they cannot be “*within* an item.”

4 For all of these reasons, Acacia’s definition should be rejected, and the Court should
5 construe “addressable” to mean “that there is a known association between each data block and its
6 storage location so that the transmission system can retrieve an individual data block by using its
7 storage location.”

8 **VI. CLAIM 45 IS INSOLUBLY AMBIGUOUS, AND THE CLAIM IS INDEFINITE.**

9 A claim, read in light of the specification, must “reasonably apprise those skilled in the art
10 both of the utilization and scope of the invention.” *Shatterproof Glass Corp. v. Libbey-Owens*
11 *Ford Co.*, 758 F.2d 613, 624 (Fed. Cir. 1985). If the claim “is subject to construction, *i.e.*, it is
12 not insolubly ambiguous, it is not invalid for indefiniteness.” *Bancorp Servs., L.L.C. v. Hartford*
13 *Life Ins. Co.*, 359 F.3d 1367, 1371 (Fed. Cir. 2004). Claim 45 of the ‘992 patent is not amenable
14 to construction and is therefore indefinite.

15 Claim 45 depends from Claim 41. It discloses the additional step of “separately storing *a*
16 *plurality of files*, each including compressed, sequenced data blocks.” The preamble of claim 45
17 makes clear that it specifically modifies the second storing step of Claim 41, *i.e.*, the seventh step
18 of “storing, as a file, the compressed, formatted, and sequenced data blocks[.]” However,
19 Claim 45 introduces an ambiguity regarding the *next* step of Claim 41, “sending at least a portion
20 of *the file* to one of the remote locations.” This step, Step 8, refers specifically to sending “*the*
21 *file*” to one of the remote locations. This reference to “*the file*” must have an antecedent basis in
22 one of the preceding seven steps. Because Claim 45 introduces the additional limitation of
23 “storing a plurality of files” into step 7 of Claim 41, the claim is rendered hopelessly ambiguous
24 because it provides no clear indication of *which* of the “plurality of files” is being sent in step 8.

25 Acacia simply ignores the ambiguity introduced by Claim 45, stating in conclusory terms
26 that because Claim 45 does not modify step 8 of Claim 41, “[i]t is obvious . . . that the file that

1 was sent in Claim 41 is the same file that was sent in Claim 45.”¹⁵ Acacia’s April 17, 2006,
2 *Markman* Brief at 63. However, the reference to a plurality of files is fatal to a finding that it is
3 definite. A simple example highlights the confusion Claim 45 introduces. If two individuals state
4 that they are going to a friend’s house and that they are going to eat dinner at “the house,” the
5 house at which they are going to eat is clear — the friend’s house that they are visiting. If the
6 same two individuals say that they are going to visit Tom’s house, Bob’s house, Sue’s house, and
7 John’s house, and that they are going to then eat at “the house,” it is ambiguous as to *which* house
8 they are referring. In the same way, if a transmission system saves 100 files as part of Claim 41’s
9 step 7, it is hardly apparent which of the files is being sent in step 8. Claim 45 is therefore
10 ambiguous and must be held indefinite.

11 **CONCLUSION**

12 For the reasons set forth above the Court should construe the claims are set forth above
13 and should find that Claim 45 is indefinite.

25
26
27 ¹⁵ Acacia’s argument is nonsensical. Claim 45 *does not* refer to sending a file. Thus, it
cannot be “obvious” that Claim 45 refers to “sending” the same file as Claim 41.
